

Two mods. Your setup.

Computer Use + Threads

TWO MODS

Computer Use + Threads

Source code • Build prompts • Setup guide

Computer Use

Claude chooses the actions. Codex's local controls click and type inside your Mac apps. Start with the Calculator-to-TextEdit demo.

Threads

One lead chat starts separate Claude sessions, gives them jobs, watches progress and brings their answers back.

Open the source bundle first

Extract the ZIP and open START-HERE.md. It links the setup guide, complete build prompts, demos, source code and troubleshooting.

Prefer a no-install walkthrough? Open the interactive prompt guide:

two-mods-build-prompts.markkashef.chatgpt.site

Check, then install.

Keep the extracted repository in a permanent folder.

What you need

A compatible mod-enabled Claude Code runtime. Threads also needs tmux, terminal login and a trusted project folder. Computer Use needs macOS and Codex computer use already configured in the ChatGPT Mac app. Python 3 runs the setup helper.

1. Open Terminal in the extracted repository and check:

```
python3 scripts/setup.py
```

This is read-only. Follow any missing-prerequisite instructions. A passing check is not a completed live demo.

2. Read docs/INSTALL.md, then install:

```
python3 scripts/setup.py --apply
```

The setup refuses to overwrite an existing bridge or duplicate mod. For an existing installation, use the migration section rather than deleting files blindly.

3. Open a NEW Claude chat. Run:

```
/codex-cu status  
/threads setup
```

Threads preserves the filmed bypass-permissions default. Before creating helpers, use /threads mode default if you want normal permission prompts. Computer Use starts with auto-approve off.

Try the opening demo.

Calculator → TextEdit / no dragging required

Paste prompts/computer-use-demo.txt into Claude after /codex-cu on. Approve only the apps you want it to use.

Use Codex computer use for this entire demo. Bring each app forward while you use it so I can watch.

1. Open Calculator and calculate 149×12 . Read the answer from Calculator.
2. Open a new TextEdit document and write:

My subscription costs

\$149 a month

\$(the answer from Calculator) a year

3. Make the title bold and the document text large enough to read on camera. Use the app's menus and keyboard shortcuts.
4. Leave the finished document visible.

Use the actual apps through Codex computer use. Don't use Terminal, scripts, or file-writing tools to produce the result.

Look for this result

Calculator shows 1788. A new TextEdit document shows \$149 a month and \$1,788 a year, with a bold title. Check the tool call to confirm the mod route. File-writing or Terminal output does not count as this app-control demo.

Give one chat a team.

Start small. See the answers return.

Open Claude in `examples/subscription-demo/` and accept the folder trust prompt. This deliberately imperfect sample is safe to review without private data or network access.

Start two helpers

Paste `prompts/threads-demo.txt`. Reviewer uses Opus to inspect the code; Checker uses Haiku to check the README examples. Both are read-only. Confirm the actual sessions and models in the panel.

Steer one while it works

Paste `prompts/threads-steer.txt` while Reviewer is still running. Check that the returned answer follows the correction. If it finished too quickly, use a larger public sample and rehearse again.

Collect the result

Wait for both useful answers in the main chat. “Done” labels alone are not the result. Any cost is an API-equivalent estimate, not your bill.

Then try a plan

Use `prompts/threads-plan.txt` in a fresh copy of the sample. Review the plan before approving changes. Each step leaves a note for the next.

If something fails

Read `docs/TROUBLESHOOTING.md`. Start with login, tmux, folder trust and a fresh chat. Respect denied app access. Do not solve every error by allowing everything.

The source passed local automated tests. New-machine installation and a live replay of the exported package remain recipient checks. See `docs/VERIFICATION.md` for the exact scope.
